

TEAM VISHAL

# VMessenger

Android Based Chat Application with Firebase

# AIM ?

By creating a personal chat application, We can have more control over the features and design of the app.

For example, If I may want to incorporate specific functionalities that are not available in existing chat applications, such as custom emoji sets or the ability to integrate with other apps I use frequently.

And the main thing is Nowadays other social media platforms are very famous because of their security issue, so we thought of creating an app for personal chatting and keeping our data secure.

AVAILABLE

# FEATURES
